

## **ArchSite Beta Version**

### **Issues and Enhancements**

#### **Pending issues/enhancements:**

1. Data Extract of Archaeological Sites
2. Shapfile upload
3. Export tabular data results
4. Change label on Print tool to be more descriptive
5. Add a button to return to Draft Sites in Edit Sites tool
6. After validating the data and there are issues, navigate to fields with issues
7. Enhancement: when a search is completed zoom to the extent of the results, or at least give this option as a button for the user to mash
8. Enhancement: bookmark the counties to be able to zoom to them. That was a good feature of version 1

#### **Resolved Issues:**

1. Find features task: the pulldown to search through fields froze up the application due to a "long-running script"
2. Find features task: the pulldown to search through fields froze up the application due to a "long-running script"
3. Another issue with the find features task: it did not want to search after adding a few parameters. The search button simply did not engage
4. When the find features by field is filled in and it is loading, it just kept cycling (for 5 minutes) and never showed any results
5. Clear buttons seem locked up after doing an initial search
